## Vorwort / Preface

The fourth volume in the series ‘Research on Late Antiquity and the Middle Ages’ contains the papers presented at the 27<sup>th</sup> international symposium dedicated to ‘Major Issues in the Early History of the Middle Danube’ which took place on 4–7 November 2015 in Ruma, in the province of Vojvodina, Serbia, and is now published under the title of the present book.

The conference was organised by the editors of this volume and their institutions, the Leipzig Centre for the History and Culture of East Central Europe (since 1 January 2017 Leibniz Institute for the History and Culture of Eastern Europe [GWZO]) and the Institute of Archaeology in Belgrade, in collaboration with the institutes of the academies and universities of the ‘Major issues’ circle in Brno, Nitra, Vienna and Krakow.

The region of Syrmia forms the focus of current and future research programmes of the Institute of Archaeology in Belgrade and for this reason it is not hard to explain the choice of venue for the conference. The Institute has been involved for decades in research on this key region, located on the northern fringes of the Balkan Peninsula in the Roman province of *Pannonia Secunda*, first and foremost through the excavations in *Sirmium*. But another Pannonian Roman town, *Bassiana*e, was also investigated in recent years by geophysical and photogrammetric surveys (conducted by the Ludwig Boltzmann Institute, Vienna) and it offers great opportunities for future excavation projects.

For the GWZO, the research project ‘Continuity and discontinuity of Christianity on the middle and lower Danube between Late Antiquity and the High Middle Ages’ was instrumental in shaping the theme of the conference. Christianity represented innovation, continuity, tradition, identity and power at various times in the period under examination, and it left behind a multiplicity of traces. In the Danube provinces, the Christian religion played a crucial role as a pillar of continuity in the timespan from the fifth to the ninth century AD, forming part of Roman identity. Changes also took place under its influence in the lower Danube region and its hinterland, where the imperial presence endured until the seventh century.

The title of this volume (*GrenzÜbergänge/BorderCrossings*) is a play on words in German intended to render the theme of the conference. The meeting sought to address questions of interdisciplinarity and periodization, using the Middle Danube region between AD 300 and 800 as a case study, to lay the foundations for a discussion concerning aspects of ‘borders’ and ‘crossings’ that separate and connect different periods, spaces and scientific approaches. The terms employed in research on this period, such as ‘Late Roman’, ‘Early Christian’, ‘Early Byzantine’ or ‘Late Antique’, are frequently applied indiscriminately, and are either used as equivalents or, conversely, taken to represent a chronological sequence. These stances often reflect different research traditions and regionally circumscribed research domains.

The conference was organised in four sessions, entitled ‘Crossing Borders between Rome and Barbaricum’, ‘Early Christianity’, ‘Transformations of Roman Structures’ and ‘On the Edges of Byzantium’. The papers made clear that many frontiers become less distinct the closer one gets to them. What is taken to represent a break from the perspective of current research often turns out to be a political event, whose impact appears to be rather limited at a regional or local level. Moreover, the results of archaeological research are significantly changing our view of the historical trajectory of the Balkan provinces in Late Antiquity, which followed a dynamic evolution well into the sixth century AD. The fact that the seventh century marked a real break in the Middle Danube region appears, on the other hand, to be a common denominator. It can be documented in many different ways in the archaeological evidence available.

## Vorwort

As the conference was held in Serbia, a significant number of contributions drew on research concerning the northern and central Balkans' heritage, enlarging the 'Major issues' research group's usual area of expertise, i.e. Eastern Middle European Barbaricum. In addition to the conference papers, a poster session was organised in the Municipal Museum in Ruma, where current archaeological research projects dedicated to the protection and restoration of the imperial palace mosaics at *Sirmium*, settlement patterns in the environs of *Sirmium*, and results of new excavations at Keszthely-Fenékpuszta and in a *villa rustica* in the vicinity of Ruma, our conference host town, were presented. The conference excursion took us to Sremska Mitrovica, ancient *Sirmium*. Stefan Pop-Lazić from the Institute of Archaeology in Belgrade, and Biljana Lučić from the Institute for the Protection of Cultural Monuments in Sremska Mitrovica guided us around the archaeological sites and the imperial palace and explained the recent research and heritage issues related to this important town. The participants also had the chance to visit the permanent exhibition at the Museum of Srem in Sremska Mitrovica and at the Museum of Vojvodina in Novi Sad.

Three further contributions complement this volume, as their topics are closely related to our theme: they were originally presented at a session coordinated by the GWZO at the 2013 International Medieval Congress in Leeds entitled 'Central Places in the Middle Ages, I: Eastern Central Europe'. There, historians and archaeologists discussed the role of central places in terms of their political, economic, social and/or religious functions. The session focused on the bilateral development in Eastern Central Europe, where, to the south of the Danube, it was often the Late Antique, Roman towns that accommodated the early medieval centres, whereas to the north of the Danube new central places developed from other cultural backgrounds.

We would like to take this opportunity to thank the Austrian Archaeological Institute, the Institute of Prehistoric and Historical Archaeology and the Faculty of Historical and Cultural Studies of the University of Vienna, as well as our own institutions in Belgrade and Leipzig for their generous financial and organisational support of the conference.

We also thank our colleagues for their painstaking editorial work, especially Eva-Maria Tepes for her review of the contributions in German to this volume and Madeleine Hummler for her revision of the articles in English.

Last but not least we are most grateful to all our colleagues for presenting their results at the conference and for submitting them to scrutiny in this volume. Research is alive and well on both sides of the Danube and is bound to offer new perspectives and openings for wide-ranging international exchange.

Leipzig, Belgrade, December 2016

## A non-wandering soldier's grave? The seventh-century burial in Davidovac (southern Serbia)

### Introduction

In the course of large-scale rescue excavations prior to the construction of the E75 motorway on Corridor X in the southern part of present-day Serbia, the Davidovac–Gradište site was explored<sup>2</sup>. The locality is situated in the centre of the Vranje–Bujanovac valley by the South Morava, south-west of the village of Davidovac.

The explored area was 1,025 m long and 35–50 m wide (Fig. 1). It consisted of five units. The surface of 2,540 m<sup>2</sup> was excavated by 60 trenches and soundings. Some 1.5 meters thick cultural layer dated to the Roman and Late Roman periods was recorded. Between the Vranje–Bujanovac regional road and the south-western part of Davidovac, part of a Roman cemetery with cremation burials was explored, dated to the second and third centuries, as well as two large Late Roman buildings. A further 700 m<sup>2</sup> were excavated on the hill in the north-western part of the site, where 67 Late Roman brick-built gra-

ves were discovered, dated to the second half of the fourth and the first half of the fifth century. At the bottom of the south-western slope of this hill the remains of a Roman settlement from the second and third centuries were investigated<sup>3</sup>. The discovery of a 7.70 m wide Roman road (*Via publica*), excavated over a length of about 130 m, was among the most important results of the 2011 campaign. The road runs in a northeast-southwest direction, almost parallel to both the present regional road and the new E75 motorway (Fig. 1). This communication route was of the utmost importance, connecting *Naissus* and *Scupi*, two major cities in the central part of the province of *Moesia Superior*, which was later divided into several provinces, including *Dacia Mediterranea* and *Dardania*.

There are not enough historical data about the *Naissus-Scupi* Roman road. In a medieval copy of the Roman itinerary, in the section between these two important cities, there are no indications of stations, forts or settlements<sup>4</sup>. On the

<sup>1</sup> The text stems from the projects 'Romanization, urbanization and transformation of urban centres of civil, military and residential character in Roman provinces in the territory of Serbia' (No. 177007) and 'Urbanization processes and development of medieval society' (No. 177021), funded by the Ministry of Education, Science and Technological Development of the Republic of Serbia. Special gratitude is owed to William Bowden, Philipp Niewoehner and Raffaele D'Amatto for providing us with the indispensable literature, to Željka Temerinski, Milica Marić-Stojanović and Milan Čolović, conservators of the National Museum, Belgrade, to Igor Gavritukhin and Ádám Bollók for discussion, and to Miro Radmilović and Bojan Popović for the post-production of the illustrations.

<sup>2</sup> The excavations by a twenty-member interdisciplinary team of the Institute of Archaeology, Belgrade, led by Sofija Petković, lasted from 22 August to 15 December 2011.

other hand, archaeological research so far, even if not very intensive, points to their existence<sup>5</sup>. Although there is no consensus on this issue among historians<sup>6</sup>, rescue excavations at the Davidovac-Gradište site have provided evidence of a large Roman settlement, probably a *mansio* on the *Naissus-Scupi* road, the route of the *Via publica* once connecting *Viminacium* on the Danube limes, the capital of *Moesia Superior*, with the towns in the interior of the province and, further to the south, with the *Vardar* (*Axios*) valley, the neighbouring province of *Macedonia* and the town of *Stobi*.

Due to lacunae in the Roman itineraries, it is not possible to identify the station in David-

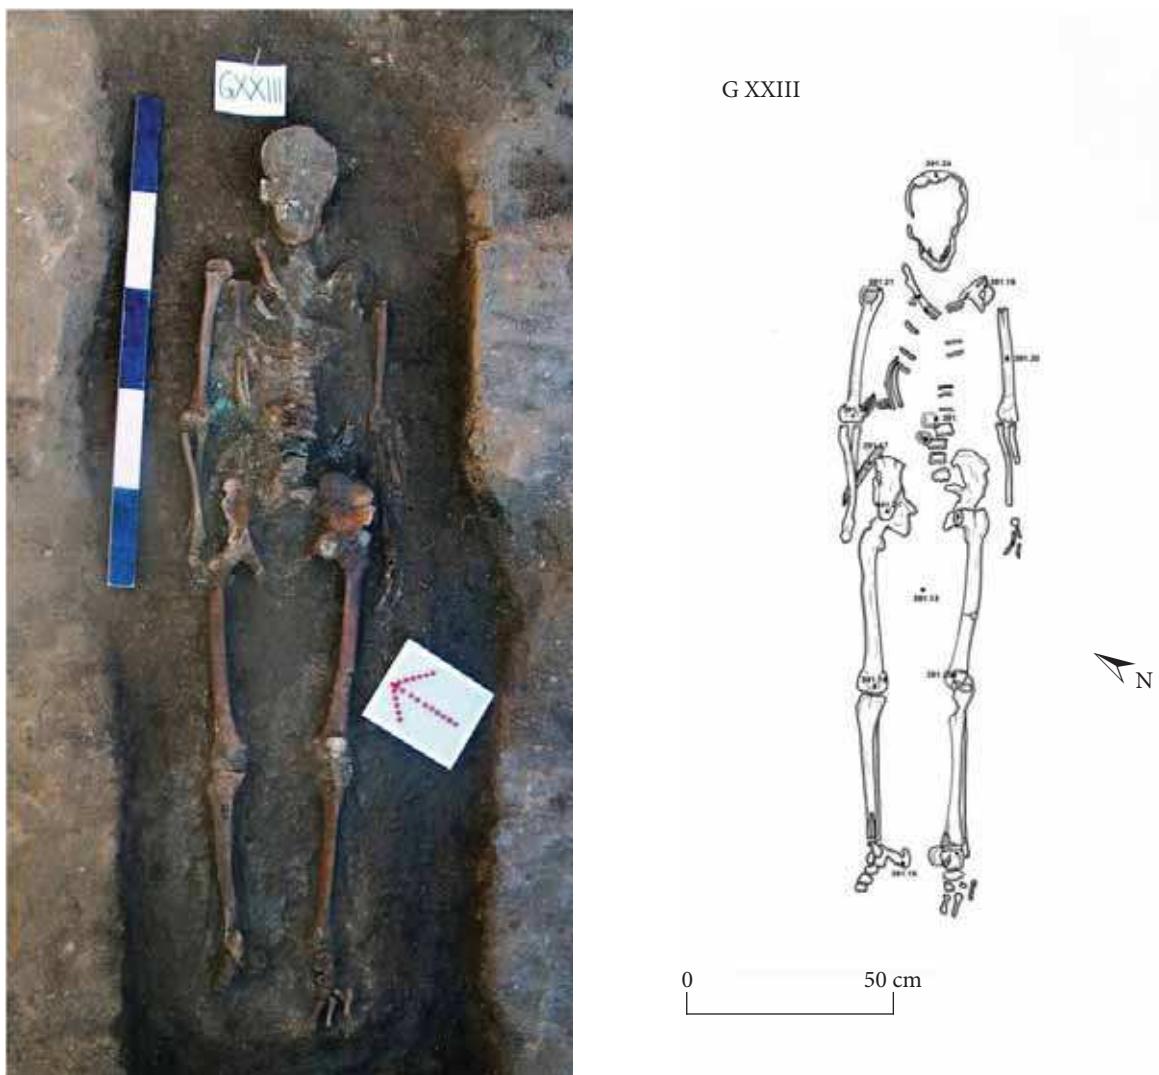

vac (*Mansio...*). However, it can be assumed that from this position vicinal roads also led to the west, to *Ulpiana* (now Gračanica), and eastwards to *Pautalia* (present-day Kyustendil). The archaeological finds from the water channels alongside the road suggest that this part of the *Via publica* was used from the second to the fourth centuries, and was flooded afterwards.

### The Davidovac grave

In a layer of river deposit accumulated above the Roman cremation cemetery and the road a solitary soldier's grave was discovered. The grave,

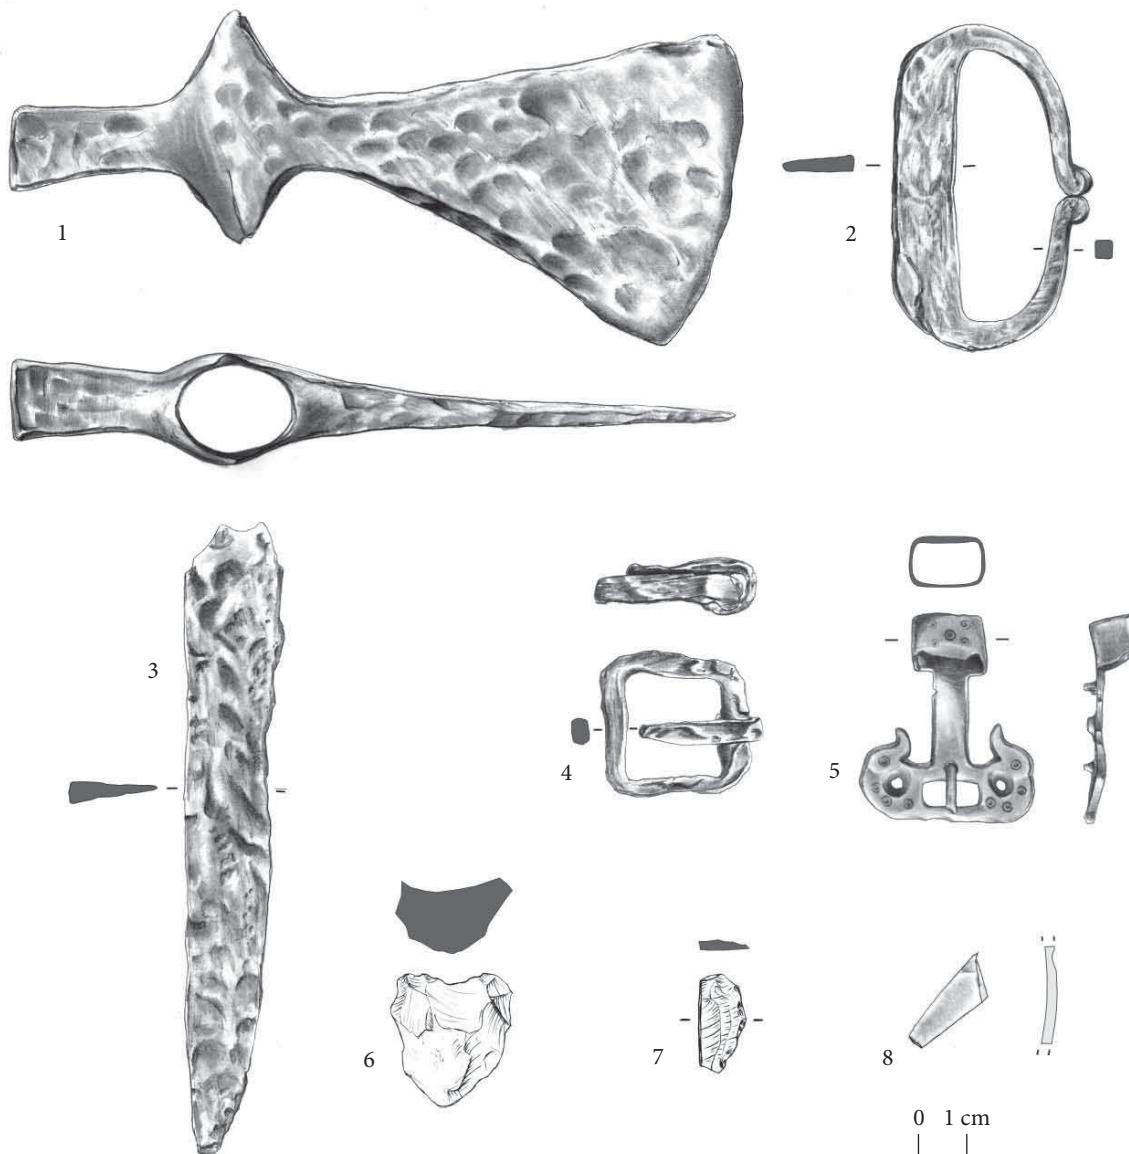

**Fig. 2** Davidovac- Gradište, Grave XXIII.

labelled G XXIII, was unearthed in Trench 45, located in the area of the cremation necropolis. The 25 m long and 5 m wide trench was oriented northwest-southeast. As the presence of a 1.20 to 1.50 m thick layer of river deposit (Layer A) had already been ascertained in this part of the site, it was excavated by machine – under continuous monitoring by an archaeologist – to reach the Roman cultural layer (layer B). Therefore, as soon as an iron object was detected in front of the machine's bucket, the work was stopped. This battle axe was, by all appearances, originally placed beside the head of the deceased; after this initial discovery regular archaeological excavations took place.

In a simple grave, a shallow cut into the sandy river deposit, oriented northeast-southwest and measuring c. 1.90 m by 0.60 m, an adult male was buried. The deceased was laid on his back, with the arms stretched along the body. The sides of this oval grave-pit were difficult to define. The skeleton was poorly preserved, especially the skull, which was crushed under the weight of soil (Fig. 2).

The area where the grave was located has been successively flooded by the South Morava river, so both the human and archaeological remains were seasonally under water. During the Late Roman period the situation was similar – this area was being flooded probably from the

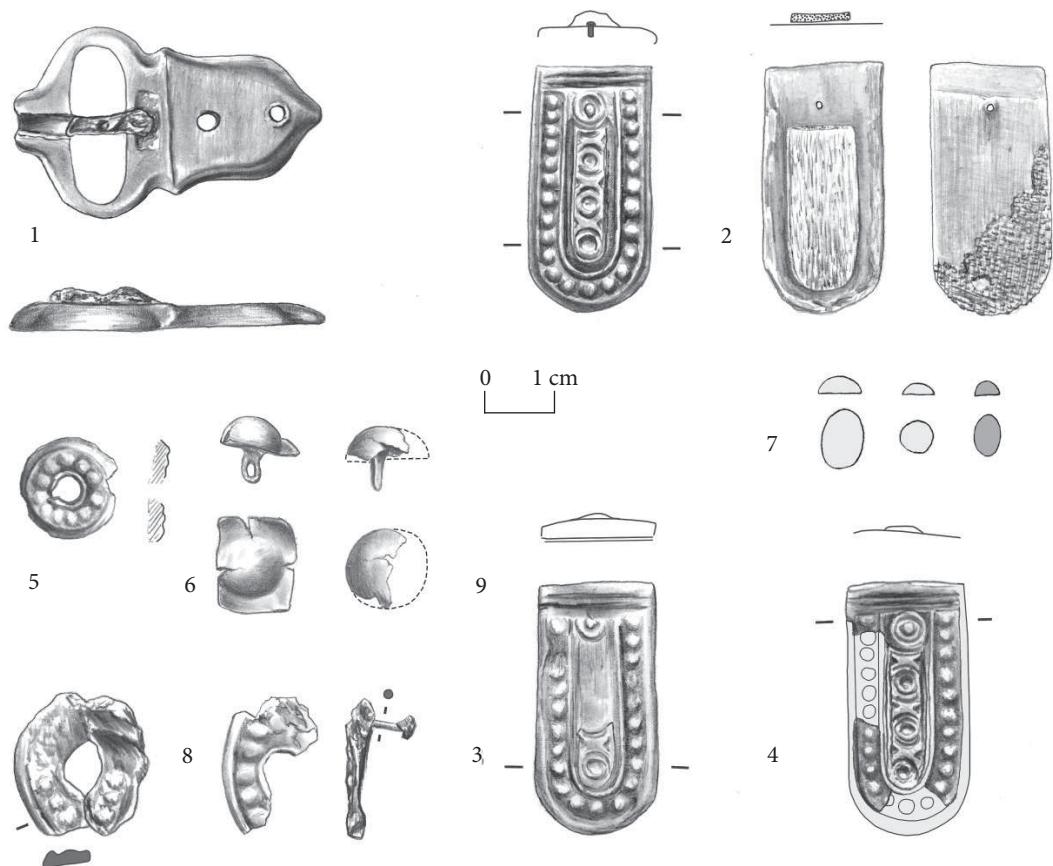

**Fig. 3** Davidovac-Gradište, Grave XXIII: 1 Battle axe (Cat. no. 1); 2 Strike-a-light (Cat. no. 14); 3 Knife (Cat. no. 2); 4 Buckle (Cat. no. 4); 5 Purse buckle (Cat. no. 13); 6–7 Flints (Cat. no. 15); 8 Fragment of glass vessel (Cat. no. 16).

second half of the fifth century or the beginning of the sixth, as the settlement and *Via publica* had ceased to exist under the deposit of river mud and sand. The grave is virtually the only archaeological finding post-dating the flooding of the excavated area in the Antiquity; it was a solitary burial. In what follows we present the archaeological and anthropological analyses of the finds from the Davidovac grave.

### Archaeological analysis

This person was buried with a battle axe near the head and a belt around the waist. A knife and a leather purse were suspended from another belt with an iron buckle. Once containing a strike-alight and flints, the purse with its typical bronze buckle was discovered behind the back of the deceased (Fig. 2–4).

**Fig. 4** Davidovac-Gradište, Grave XXIII: 1 Buckle (Cat. no. 4); 2–4 Strap-ends (Cat. no. 5–7); 5 Belt fitting (Cat. no. 9); 6 Buttons (Cat. no. 12); 7 Glass inlays (Cat. no. 10); 8 Belt fittings (Cat. no. 8).

#### Finds catalogue

1. Battle axe (C 369/11) found to the right of the skull. Forged in iron, it has a trapezoidal blade, a rhomboid socket and a prismatic butt. Length: 15.5 cm, blade width: 6.5 cm (Fig. 3,1).
2. Knife (C 736/11) found in the right pelvic bone area. Forged in iron, single-bladed, fragmented. Length: 14.5 cm, blade width: 2.2–0.8 cm (Fig. 3,3).
3. Buckle (C 737c/11) found in the waist area. Forged in iron, its frame is trapezoidal with rounded corners and slightly concave sides. It is square in cross-section; the pin is fragmented. Dimensions: 2.9 cm × 3 cm (Fig. 3,4).
4. Buckle (C 738c/11) found in the waist area, beneath the iron buckle (Cat. no. 3). Cast in bronze in a single piece; its loop is elliptical and its plate is pierced twice (originally once)

- for rivets. Dimensions: 4.4 cm × 2.7 cm (Fig. 4,1).
5. Strap-end (C 738a/11) found in the right elbow area. It is made in three parts. The front is a pressed bronze sheet, decorated with pseudo-granulation along the edges. In the middle of it an elongated silver strip is inlaid, with three hammered recesses, and secured with a small silver rivet with a globular head. The back plate is a flat bronze sheet. On its outside cloth is preserved by the patina. The two plates were held together by the same rivet. Between them there was a smaller tongue-shaped wooden plate. Dimensions: 3.7 cm × 1.7 cm; 2.4 cm × 1.1 cm (wooden plate); 2.4 cm × 0.6 cm (silver inlay). Originally identical to Cat. nos. 6 and 7 (Fig. 4,2).
6. Strap-end (C 738b/11) found between the chest and the right elbow. Originally identical to Cat. nos. 5 and 7, but damaged by patina. Dimensions: 3.6 cm × 1.8 cm (Fig. 4,3).

Fig. 5 Davidovac-Gradište, Grave XXIII: Small strap-end (Cat. no. 5).

7. Strap-end (C 738e/11) found in the pelvic area beneath the bronze buckle (Cat. no. 4). Originally identical to Cat. nos. 5 and 6 but damaged by patina. The back plate is missing. Dimensions: 3.6 cm × 1.8 cm (Fig. 4,4).
8. Belt fittings (C 737d/11) found in the waist area. Two fragmented bronze sheet fittings, elliptic in shape, decorated with pseudo-granulation around their central perforations. In one case a rivet was preserved. Diameter: 2 cm (Fig. 4,8).
9. Decorative belt fitting (C 737e/11) found in the waist area. Made out of silver sheet and filled with lead, it is round in shape and decorated with pseudo-granulation along the edge. Diameter: 1.4 cm (Fig. 4,5).
10. Three glass inlays (C 738g/11) for the metallic parts of the belt set, found in the waist area, close to the bronze buckle and the strap-end (Cat. nos. 4 and 7). All three inlays are oval in shape, with flat bases and concave upper sides. Two inlays are colourless, and one is dark blue. Dimensions: 0.4–0.8 cm (Fig. 4,7).
11. Nine decorative rivets (C 738f /11) found in the waist area. The heads are hammered from bronze sheet and filled with lead, attaching them to small wire rivets. Length: 0.7 cm; diameter: 0.8 cm (Fig. 4,9).
12. Three decorative buttons (C 738f /11) found in the waist area. The buttons are rectangular in shape, each domed in the middle. Hammered from bronze sheet, they were filled with lead to hold bronze wire loops for sewing to the garment. Length: 1.2 cm; diameter: 0.9 cm (Fig. 4,6).
13. Purse buckle (C 738d /11) found under the left ilium. A T-shaped cast bronze buckle, decorated with a pair of duck (or dolphin?) heads facing one another and flanking the frame with the pin. The opposite end is finished with a rectangular belt loop. The buckle is decorated with carved lines and ring-and-dot ornaments. Dimensions: 1.6 cm × 4.2 cm × 3.6 cm (Fig. 3,5).
14. Strike-a-light (C 737a/11) found left of the pelvic area, where there used to be a leather purse. D-shaped and forged in iron, it has spirally twisted ends. Dimensions: 7 cm × 4.2 cm (Fig. 3,2).
15. Three flints (C 737b/11) found left of the pelvic area, where there used to be a leather

- purse, together with the strike-a-light (Cat. no. 14). On one of them there was a lump of organic material (wood?) and corroded iron. Dimensions: 2.8 cm × 2.6 cm; 2 cm x 1 cm; 2.2 cm × 2 cm (Fig. 3,6–7).
16. Glass vessel (C 735/11) found in the waist area. Fragment of a light green glass vessel. Dimensions: 2 cm × 2.1 cm (Fig. 3,8).

### Discussion of the grave goods

Thanks to the existing pictorial evidence, we know that the Byzantines used multi-part belt sets throughout the sixth and seventh centuries<sup>7</sup>, which had an influence on the increase in number of metallic decorative elements on belts worn by the Lombards, Bavarians and Alamanii<sup>8</sup>. All in all, the Early Byzantine belts derived from an international style; we also know of Sasanian multi-part belt sets of that time. In Eu-

rope the largest group comprises Avar belts<sup>9</sup>; in this article we shall not use the very large corpus of related Avar finds, but only some illustrative examples.

In comparison to Avar examples, Byzantine belt sets are rarely found; therefore it is not easy to list finds analogous to the small sheet strap-ends from Davidovac (Cat. nos. 5–7: Fig. 5). This is because in the sixth century the *Rhomaioi* practised burials without such pieces of costume or any equipment, including weapons<sup>10</sup>, and it is unlikely that many such items would be found on Balkan hillforts<sup>11</sup>. At least in Serbia, Early Byzantine graves have not been sufficiently investigated or published<sup>12</sup>, and this is especially the case of the seventh-century burials. Only recent breakthroughs in the study of belt elements of that time, more often than not from non-Byzantine contexts<sup>13</sup>, have made it possible to study the seventh-century Central Balkan finds<sup>14</sup>.

**Fig. 6** Davidovac-Gradište, Grave XXIII:  
Glass inlays (Cat. no. 10).

**Fig. 7** Davidovac-Gradište, Grave XXIII:  
Small round fitting (Cat. no. 9).

Before such syntheses were available, it could occur that Byzantine finds were used as evidence for an Avar invasion of a town in Greece<sup>15</sup>, or that their finds from the seventh century were dated earlier, to conform to the traditional view that in the Balkans the Byzantine rule ended at the turn of the sixth to the seventh century<sup>16</sup>. In addition, there is also the perennial question of whether certain belts in foreign (Avar) use were only made according to Byzantine fashion, or were authentic Byzantine products<sup>17</sup>.

In terms of decorative composition, the strap-ends from Davidovac are similar in one detail – the elongated central ornament – to certain gold pieces from the famous Byzantine belt set from Divoš (?) near *Sirmium*/Sremska Mitrovica<sup>18</sup>, which we believe to have been presented to the Avars before their 626 Constantinople dis-

ster<sup>19</sup>, or to the earliest finds from the Brestovac ‘hoard’. These very small gold sheet strap-ends also had elongated central cabochon sockets, but the inlays are not preserved<sup>20</sup>. Similar is also the central position of the array of glass inlays on the small strap-end of a belt set uncovered in the area of the Baksan and Chegem rivers in the region between the Black and Caspian Seas<sup>21</sup>; such inlays from Davidovac (Cat. no. 10: Fig. 6) seem to speak in favour of the Byzantine origin of the belt.

One can also observe general similarities in the rims and central parts of the belt pieces with the fittings from the clan-leader’s grave at Petőfiszállás, dated to the second quarter of the seventh century. The small, round fitting (Cat. no. 9: Fig. 7) resembles the Petőfiszállás pieces too<sup>22</sup>, and similar combinations of finds occur in

Fig. 8 Davidovac-Gradište, Grave XXIII: Bronze buckle (Cat. no. 4).

graves at Bócsa, dated to the second third or the middle of the seventh century<sup>23</sup>, and Homokbánya<sup>24</sup>. Before conservation, the strap-ends from Davidovac showed a distinct typological feature: like many Early Avar finds, they had ribbed reinforcements on top. Such finds, assigned by Jozef Zábojník to seriation type 559, are dated to his FS phase, i.e. before 650<sup>25</sup>. They are usually flat and unornamented. On the other hand, small Byzantine (?) sheet silver strap-ends with such reinforcements formed part of spectacular Ukrainian finds such as the Martynovka treasure<sup>26</sup>, and a similar find is also known from the Kelegej burial assemblage<sup>27</sup>.

The bronze cast buckle (Cat. no. 4: Fig. 8) belongs to a common type. Numerous similar pieces come from Crimea<sup>28</sup> and South Russia<sup>29</sup>, with analogous finds also present in both Early Byzantine hillforts in the Central Balkans<sup>30</sup> and in Avar contexts. In the latter ones these single-piece *Schnalle mit U-Beschlag* are chiefly dated to the first half of the seventh century, with some finds of a later seventh-century date. It is important to note that these buckles cluster in Transdanubia<sup>31</sup>, where strong pre-Avar traditions persisted in and around Keszhely-Fenépuszta<sup>32</sup>. In the Petőfiszállás grave as many as five similar buckles were part of a sword

Fig. 9 Davidovac-Gradište, Grave XXIII; Bronze purse buckle (Cat. no. 13).

set<sup>33</sup>, and those found in the Homokbánya grave might have performed the same function<sup>34</sup>. The other metallic parts of the Davidovac belt set are not relevant for our analysis.

The purse contained an iron strike-a-light and flints (Cat. nos. 14, 15). A unique purse buckle (Cat. no. 13: Fig. 9), decorated with a pair of duck (?) heads facing one another, may be attributed to the Gáter type, stemming from the Salona-Histria type. These – not very numerous – Byzantine products are known from various regions, from Ukraine to Greece and Italy. The majority of such buckles were dated to the first half of the seventh century by Syna Uenze, and their later derivatives to the second half of that century<sup>35</sup>. In a more recent review, such finds

from Avar contexts are dated to the middle of the seventh century, or to its second and third quarters. In fact, most buckles of this type come from Avar graves. Éva Garam has collected ten such finds<sup>36</sup>, and the buckle from Svilovojevo (Szilágyi) should have been added to the list<sup>37</sup>, while the recently studied similar finds from Greece are of a more elaborate type<sup>38</sup>.

As for the axe (Cat. no. 1: Fig. 3,1), its length of 15.5 cm suggests that it was a battle axe. Early Byzantine axes of the same design were usually larger, up to around 25 cm long<sup>39</sup>, and therefore likely to have been used as tools. The size of an object is directly related to its weight: a group of 19–24 cm long Late Roman iron axes have been shown to be five to six times heavier than those

11–12 cm long<sup>40</sup>. The two classes of axes must have been manipulated in different ways and used for different purposes. The majority of Avar battle axes are between 11 and 13 cm long, but the 15–16 cm long specimens are also viewed as belonging to this group<sup>41</sup>.

## Anthropological analysis

### Methodological framework

The bone remains recovered are those of a semi-preserved skeleton<sup>42</sup>; the limitations of the anthropological analyses conducted were determined precisely by the preservation of the bone material (Tab. 1)<sup>43</sup>.

To determine the sex of this adult individual a combination of morphological and metrical methods was employed. Special attention was paid to the morphological features of the cranium (processus mastoideus, planum nuchale, tubera frontale et parietale, protuberantia occipitalis externa (Broca)) and the mandible (general appearance: corpus mandibulae, ramus mandibu-

lae and angulus mandibulae, mentum, angulus mandibulae and margo inferior), using the method established by a group of European anthropologists<sup>44</sup> and by Jane E. Buikstra and Douglas H. Ubelaker<sup>45</sup>. Metric elements of the mandible were also analysed, relevant for sex determination<sup>46</sup>. The indices, calculated on the basis of the metric elements, are shown in Table 2.

The mesiodistal and vestibulo-lingual diameters were measured for teeth, using a method approved by Hillson (Tab. 3)<sup>47</sup>. Differences in tooth size were observed mostly on canines, but also on molars, premolars and incisors<sup>48</sup>.

Morphological and metrical elements were also observed in the analysis of other postcranial bones, particularly the development stages of tuberositas deltoideae, tuberositas radii and margo interosseus (radius), tuberositas ulnae and margo interosseus (ulna) and linea aspera. Metrical elements played a more significant role in the sex determination of postcranial remains, and the indices calculated on their basis are shown in Table 4, separately for the right and left sides of the skeleton.

Cosma (ed.), Warriors, weapons, and harness from the 5<sup>th</sup>–10<sup>th</sup> centuries in the Carpathian Basin. Ethnic and Cultural Interferences in the 1<sup>st</sup> Millennium B.C. to the 1<sup>st</sup> Millennium A.D. XXII (Cluj-Napoca 2015) 129–146 here 139 f.

<sup>42</sup> Partial preservation refers to the situation where an entire skeleton is present inside the grave, but the bones are brittle and break during excavation. Vertebrae and long bones were highly decomposed. Some bones (pelvic bones, rib fragments, sacrum fragment, lower end of the right humerus, upper ends of the right radius and right ulna, lower end of the left ulna) show traces of green colour due to oxidation of the metallic objects.

<sup>43</sup> Together with human bones, seven fragmented animal bones, 1–4.5 cm in length, were recovered.

Mandibular Index	84.67
Mandibular Body Robusticity Index	22.05
Mandibular Ramus Index	41.42

Tab. 2 Cranial measurements and indices.

Given to the degree of bone preservation, individual age was estimated using only Vallois's scheme, i.e. the obliteration of skull sutures<sup>49</sup>. Changes in dental material were compared with Brothwell's<sup>50</sup> numerical classification of the occlusal surface attrition of the molars in relation to age, and changes in the occlusal surface of all teeth were studied in relation to age using the results obtained by Lovejoy<sup>51</sup>. Morphological changes in sternal rib ends – metamorphoses of depth, joint cavities, shape, edges and ridge configuration – were examined, together with the general state of the bones, based on nine (0–8) phases of progression covering ages from 18 to over 70 years<sup>52</sup>.

Epigenetic variations on the cranium and the postcranial skeleton were observed<sup>53</sup>, and stature was calculated using Trotter and Gleser's formula for the maximum length of the humerus<sup>54</sup>.

## Results of the analysis

The Davidovac grave contained the skeletal remains of a male aged 30–40 and  $175 \pm 5$  cm tall (Tab. 1–5; Fig. 10–12). The only palaeopathological changes observed were osteoarthritis (at the lower end of the right humerus, the upper ends of right and left ulnae, and the right and left tali) and osteochondritis disseccans in a squatting facet on the right tibia, 1.4 cm in diameter. Poirier's facet was noted on the left femur.

The dental analysis showed the presence of the following teeth: 12, 14, 15, 16, 17, 18, 24, 25, 26, 28, 33, 35, 36, 37, 38, 45, 47 and 48. Tooth 46 (?) was lost antemortem, and teeth 31, 32, 34, 41, 42, 43 and 44 postmortem. First-degree abrasion (in enamel) was observed on teeth 12, 14, 15, 33, 35, 38, 47 and 48, second-degree abrasion (exposed dentine) on teeth 16, 24, 25, 28, 37 and 45, third-degree abrasion (to the bottom of the fissure) on tooth 36 ( $\rightarrow 4^{\text{th}}$ ), and fourth-degree abrasion (open pulp cavity) on tooth 26. Periodontal disease and calculus were highly prominent. Caries was present on teeth 25, 28 (both distal, between crown and root, 0.6 cm in diameters), 46 (the so-called gross-gross caries (?)) and 47 (gross-gross caries). Occlusion could not be determined (Fig. 10,3–5).

The epigenetic characteristics noticeable on norma occipitalis were os sutura lambdoideae (on the right side,  $1.0 \times 0.5$  cm in size, and one on the left side, damaged post-mortem) and prominent linea nuchae suprema (Fig. 10,2). On the postcranial part of the skeleton, facies articularis superior atlantis bipartita were detected on the

Tab. 3 Odontometric examination of the teeth.

right side, and trochanter tertius on both femora. Entheses were very prominent on muscle and ligament attachment points of the right clavicle, right scapula (the left ones are not preserved), right and left humeri, right and left radii, right ulna (even the olecranon was slightly separated), left ulna, and right and left femora (Tab. 5, Fig. 11–12). Two squatting facets were noticed on the right tibia (facies articularis calcanea media and facies articularis calcanea anterior were clearly separated on both tali), which was much better preserved than the left one, followed by osteochondritis dissecans in one of them.

It should be added that the tuberculum conoides of the right clavicle was very prominent too; the bodies of both femora were pronouncedly flattened throughout their entire length in the anterior-posterior direction.

To sum up, the deceased was a 30–40 year-old male,  $175 \pm 5$  cm tall. The cause of death could not be determined. Periodontal disease and

calculus were very prominent, while caries was observed on four teeth. The only noticeable paleopathological changes were osteoarthritis on several bones and osteochondritis dissecans in a squatting facet on the right tibia. Entheses occurred at almost the same attachment points on both arms and were most expressed in the muscles controlling shoulder movements (forward, backward and circular movements), elbows (flexion and extension movements), and wrists (gripping and circular movements), followed by osteoarthritis. It is unlikely that this well-trained person was an archer; he may have been trained with sword and shield instead. Squatting facets have proved to be common in the bones of members of groups known habitually to spend a lot of time in the squatting posture<sup>55</sup>. In this case their occurrence may perhaps be associated with a lengthy life in military tents without appropriate furniture, and the reason for the occurrence of osteochondritis dissecans could be trauma

## Discussion and conclusion

According to the dating elements listed above the Davidovac burial belongs to the first half of the seventh century. A more precise date would be its second quarter, but we should bear in mind that the majority of parallels are from Avar

contexts, and perhaps of a slightly later date than the Byzantine finds which may have influenced their production. On the other hand, we should note that the bronze buckle was re-perforated (Cat. no. 4: Fig. 8). But who could have been buried in such an untypical way? The results of the anthropological analysis indicate that it was an adult and well-trained man. With his battle-axe and even a belt, both Byzantine products, this man was (buried like) a soldier.

Very little is known about the Byzantine presence in the Central Balkans after the collapse of the Danube limes in c. 615<sup>57</sup>. From the written sources we are informed that the Avars plun-

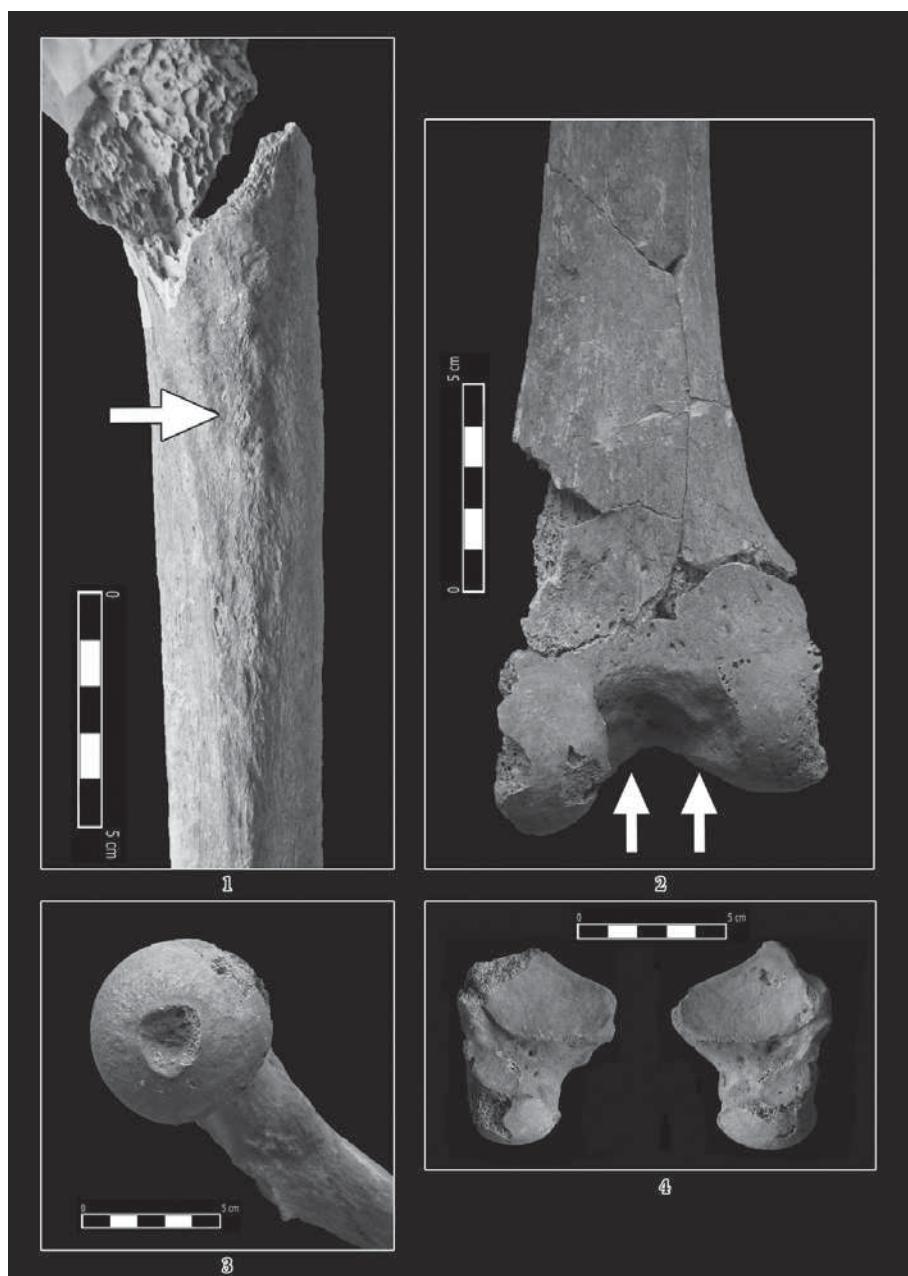

red these territories and captured and re-settled large numbers of local inhabitants shortly afterwards<sup>58</sup>. Almost all the existing evidence suggests that the Byzantines may have persisted in

this region until around the year 615<sup>59</sup>, when the Empire could still have controlled some of its Central Balkan possessions, roughly between *Naissus*, *Justiniana Prima* and *Serdica*<sup>60</sup>. Yet, apart from sporadic finds of coins and metallic

objects – most of them accidental and, in the case of the small finds, likewise datable to the end of the sixth century – there were virtually no clearly defined seventh-century Byzantine contexts in this region. On the other hand, two clusters of

<sup>59</sup> V. POPOVIĆ, La descente des Koutrigours, des Slaves et des Avars vers la mer Égée: le témoignage de l'archéologie. *Comptes Rendus Séances Acad. Inscript.* 3, 1978, 597–648 here 626–634.

<sup>60</sup> B. BAVANT/V. IVANIŠEVIĆ, *Iustiniana Prima – Caričin Grad* (Beograd 2003) 50.

such finds have been observed. The first comprises Byzantine finds from sites along the Danube, dated to the end of the sixth and the first third of the seventh century, and the second brings together mid- and even late seventh-century Byzantine finds from the South Morava valley<sup>61</sup>.

The Davidovac burial comes precisely from this area. Even though there is little doubt about its (early) seventh-century date and Byzantine provenance, it is not easy to assess the wider context of this burial, because in this area the sixth-century fortresses are not well researched. We know of the Sučidava-type belt buckles and of a so-called masque-type belt fitting from Davidovac-Gradište, and about some other finds, including coins, from the surrounding forts<sup>62</sup>. These finds are a clear indication of the sixth-century use of the sites, and the belt fitting from Davidovac can be dated to the second half of that century<sup>63</sup>. The same is true of the so-called Dalmatian-type fibula (Fig. 13), found in the course of the 2011 excavations at the foot of the hill on which the Davidovac-Gradište fort is located; despite their

'Dalmatian' label, the number of these fibulae is growing not only in the Western, but also in the Central Balkans<sup>64</sup>. The unexcavated Roman fortification of Davidovac-Gradište, however, was not included in the latest list of Early Byzantine sites in present-day Serbia<sup>65</sup>.

It was roughly at this time that Christian funerary practices of the Roman population in Avar lands changed to some extent, probably in order to emphasise their distinct identity in a multicultural environment<sup>66</sup>. Yet, one can observe similar processes in the territories of the Empire as well. It was not a strict rule, but from around the year 600 some individuals were being buried with some of their dress accessories and/or grave gifts. This was not against Christian faith and morals<sup>67</sup>: for example, we know of Thomas the Presbyter, buried in Corinth with a mug bearing his name, and parallel to this process there was the increasing wish to be buried *ad sanctos*, which led to the successive re-use of the same tombs. Members of civilian and military elites were buried with their belts<sup>68</sup>; a brief mention of

a find of a Syracuse-type buckle from the Jagodin Mala cemetery in *Naissus*<sup>69</sup>, commonly dated from the end of the sixth to the middle of the seventh century<sup>70</sup>, hints at such practices in the Central Balkans too.

Weapons were among the other grave goods. The early seventh-century weapon graves are not numerous (Fig. 14). Uncommon as they are, they have been interpreted differently. Perhaps the most famous is the so-called Wandering Soldier's Grave in Corinth<sup>71</sup> – hence the title of our article. It was rectangular in shape, oriented east-west, with its cover and walls of neatly arranged reused marble slabs. The grave was dated to the end of the sixth and the beginning of the seventh century. Thanks to the presence of an Early Byzantine belt buckle of Olympia type, the date of the burial could be set at the very beginning of the seventh century<sup>72</sup>, or the first half of that century, a matter to be discussed below. Besides the hand-made vessel, the majority of the finds from this grave belong to Byzantine material culture. The sword, with a characteristic cast labrys-shaped cross-guard, is of such origin, as well as similar cross-guards from Pergamon<sup>73</sup> and Nin

in Dalmatia<sup>74</sup>, the latter erroneously described as Late Avar. The additional nine finds come from the Carpathian Basin<sup>75</sup>. A rather peculiar find from this Corinth grave is 'the silver and bronze trinket' found in the deceased's right hand.

In contrast to the above-mentioned 1937 article, in her 1974 paper Gladys Davidson Weinberg restrained herself from attributing any ethnic identity to the deceased. It is just assumed that "he had come from elsewhere, since his equipment is foreign to Corinth". The author stated that this was a carefully performed burial of an infantryman, carried out with honour by his companions<sup>76</sup>. This was not the only grave from late sixth- and seventh-century Corinth carefully constructed with *spolia*. The most intriguing finds from some burials of this kind are weapons. There were four such burials in collective tombs. On top or at the feet of the deceased individuals there were pikes or spears; arrowheads were also found, and Byzantine belt buckles from the first half and the middle of the seventh century may serve to date the burials. The graves also produced knives, strike-a-lights, finger rings and bronze chains<sup>77</sup>.

Together with the ‘Wandering Soldier’s Grave’, these graves were believed to have belonged to Slavic *foederati* garrison members<sup>78</sup>, an idea refuted by Florin Curta<sup>79</sup>, or that their origin was nomadic<sup>80</sup>. A more acceptable and somewhat broader explanation would be that these graves belonged to “Byzantine soldiers of migratory backgrounds. [...] While no specific cultural affiliations may be derived from the material evidence, the mortuary assemblages present some diversity and raise the possibility of multiple cultural origins [... and] the occurrence of these graves in two pre-existing cemeteries suggests integration within the local community and [...] a conversion to Christianity”<sup>81</sup>. Other seventh-century burials from Greece did not yield any weapons<sup>82</sup>, and the striking absence of such finds is also characteristic of non-funerary contexts in Dark-Ages Greece<sup>83</sup>.

On the other hand, some similar burials do not seem to prove the ‘migratory backgrounds’ of the deceased. One such grave comes from Pergamon, an ancient city near the Turkish Aegean coast. Another solitary grave, it was found in 2006 in an abandoned street drainage canal. The deceased was laid in the canal in a northwest-southeast direction, with three spearheads carefully placed under his right arm. Apart from two iron nails, two bronze buckles and a finger ring were also found in this grave. Due to these characteristic Byzantine objects, the grave was dated to the early seventh century<sup>84</sup>.

To assess the date of this burial, the buckles first need to be taken into account. Just as in the ‘Wandering Soldier’s Grave’, one of them was of Olympia type, but the smaller buckle<sup>85</sup> belongs to type D20 of Mechthild Schulze-Dörrlamm’s classification, dated to the first three quarters of the seventh century<sup>86</sup>. It is likely that the two weapon-graves can be dated not only to the very beginning of the seventh century, but to its first few decades.

Be that as it may, the anthropological analysis has revealed that in Pergamon an 18–22 year old male was buried, and it has been suggested that he suffered a violent death. Especially important is that, in this case, strontium and oxygen isotope analyses point to his eastern or southeastern Mediterranean origin, perhaps from the Greek islands, Western Turkey, North Africa, or the Near East. After having analysed all aspects of this burial, the authors of the Pergamon study proposed that this young man died in the course of conflicts with the Arabs<sup>87</sup>.

So the Pergamon ‘warrior’ was apparently not a distant foreigner; this burial has already been described as Early Byzantine<sup>88</sup>. With some caution, the same can be suggested for the people buried with weapons in the provinces of Albania in the Dark Ages. Bearing in mind the variable factors within the cemeteries of the so-called Komani culture<sup>89</sup>, we agree with the definition of Vladislav Popović that this culture, spanning the Dalmatian and Montenegrin coast and present-day Albania and Macedonia, was “urban, post-

antique, retarded Roman-Byzantine and, most of all, Christian”<sup>90</sup>. Together with a significant number of unfurnished graves, the Komani culture cemeteries contain graves displaying a variety of grave-gifts. The belt pieces and the jewellery suggest that this culture may be dated from the seventh century onwards. Weapons also figure among the grave goods: battle axes, swords, spearheads and arrowheads – though not in all cemeteries<sup>91</sup>. These were commonly

published as a whole, i.e. without references to particular graves<sup>92</sup>; yet there can be little doubt that a number of graves of the Komani culture contained weapons, and that the majority of the people buried did not have a migratory background.

Seventh- to eighth-century weapon burials come from both single and collective graves in Sardinia too. Throughout the island, there are at least fifteen burials showing evidence of an Early Byzantine military presence<sup>93</sup>. For example, a spearhead comes from a single grave in Nuoro<sup>94</sup>, and four spearheads and a scramasax were found in a tomb at Borutta, together with a bronze pitcher and a Byzantine bronze buckle<sup>95</sup>. Apart from the weapons, these men were buried with their clothes, and buckles of Corinth, Balgota, and Syracuse types are recorded. All these are believed to have represented parts of the uniforms of members of the Byzantine militia<sup>96</sup>.

To conclude, it seems that in the seventh century, at the time of the great crisis in Byzantium and significant territorial losses, a particular social layer of infantrymen started to be buried in a different fashion than before. It is likely that at

Fig. 14 Distribution of seventh-century Byzantine weapon graves.

this time, when the central authority was weak or completely absent, local military/militia officers and headmen appropriated some of its functions, displaying themselves with the attributes of power. Thus, we are inclined to interpret these graves in the context of social changes, and not in ethnic terms: "In the space of perhaps two generations, an urbanized or semi-urbanized society with recognisable affinities with the Roman past was transformed into one that was essentially rural, the leadership structures of which had also dramatically altered [...]. Power became individualized [...] rather than being focussed on town or state"<sup>97</sup>.

As for the Davidovac grave, it cannot be estab-

lished with certainty whether it had belonged to a member of a local garrison, or to some unit passing through the Central Balkans after the Empire had lost these territories. That this was a solitary grave does not speak in favour of the first option. Moreover, *De administrando imperio* refers to some movements of the Byzantine army after the collapse; namely, there is information that the Byzantine *strategos* was in *Singidunum* as late as around 630<sup>98</sup>. The town was by no means ruled by the Empire at that time, and the *Singidunum strategos* must have been no more than a military commander<sup>99</sup>, perhaps not of a local garrison but of the troops observing the border. The same source informs us that the Roman troops

from Dalmatia were annually sent on such missions<sup>100</sup>. A well-known grave from Čađavica in the northern part of present-day Croatia was already commented on in connection with those events – though with due caution<sup>101</sup>.

On the other hand, the written sources and scant archaeological finds point to the absence of any rule over the Balkans in the seventh century, either Byzantine or Slavic<sup>102</sup>. During this interregnum there were probably sporadic movements of Byzantine soldiers throughout the Empire's sparse former possessions. It may well be that at this time, in addition to finds which tend to indicate some low-level Byzantine persistence in the Central Balkans, some other finds and his-

torical records speak of a temporary presence of their troops there, observing the communication routes, the frontier and the (potential) enemies, and making contact with what was left of the Roman population. Although the Roman road mentioned earlier had long been flooded, this route must have kept its strategic importance. Thus the Davidovac burial may testify to these processes; we also know that the Byzantine troops trained for different 'special ops' – both infantry and cavalry – were active in no-man's lands and even behind enemy lines during the sixth century and at the beginning of the seventh<sup>103</sup>.

### Summary

In the course of rescue excavations in 2011 a grave was found at the Davidovac-Gradište site. The locality is situated in the southernmost part of present-day Serbia, in the South Morava valley, on the route of the Roman *Via publica*. In the grave, a 30–40 year old male was buried with his belt and a battle axe. The belt consists of pressed bronze sheet strap-ends and a cast bronze buckle. Alongside them there was a purse buckle, also a characteristic early seventh-century Byzantine product. The anthropological analysis indicates that the deceased had military training. Such graves are rarely found throughout the Byzantine Empire. Being very different from the sixth-century Roman burials, they were commonly attributed to migratory mercenaries of the Empire. Having surveyed similar burials of that date from Corinth, Pergamon, present-day Albania and Sardinia, we are in favour of interpreting them in the context of social changes which occurred at a time of crisis in the Empire, and not in ethnic terms.

### Zusammenfassung

#### Das Grab eines nicht umherziehenden Soldaten? Eine Bestattung des 7. Jahrhunderts in Davidovac (Südserbien)

Bei Rettungsgrabungen im Sommer 2011 in Davidovac-Gradište wurde ein Grab entdeckt. Der Fundort liegt im südlichsten Teil des heutigen Serbiens, im Morava-Tal an der Route der römischen *via publica*. In diesem Grab war ein 30–40 Jahre alter Mann mit Gürtel und Streitaxt bestattet. Der Gürtel besteht aus bronzenen, gepressten Riemenzungen und einer gegossenen Bronzeschnalle. Hinzu kommt eine Taschenschnalle, ebenfalls ein charakteristisches byzantinisches Erzeugnis des frühen 7. Jahrhunderts. Anthropologische Untersuchungen zeigen, dass der Verstorbene ein militärisches Training durchlaufen hat. Solche Gräber wurden nur selten im Byzantinischen Reich gefunden. Weil sie sich stark von römischen Bestattungen des 6. Jahrhunderts unterscheiden, wurden sie für gewöhnlich umherziehenden Söldnern im Dienst des Reiches zugeschrieben. Der Vergleich mit ähnlichen Gräbern aus Korinth, Pergamon, dem heutigen Albanien und Sardinien legt aber nahe, sie im Kontext sozialen Wandels in Zeiten der Krise des Byzantinischen Reiches zu interpretieren und nicht anhand ethnischer Kategorien.

Die Zeit zwischen 300 und 800 n. Chr. wird als Übergang zwischen Antike und Mittelalter verstanden und in der Archäologie und in den Geschichtswissenschaften zunehmend als eigenständige Epoche unter dem Label „Spätantike“ wahrgenommen. Begriffe wie „spätromisch“, „frühchristlich“ oder „frühbyzantinisch“ treten in diesem Kontext als konkurrierende Kategorien auf, die zeitlich und räumlich überlappende Phänomene beschreiben. Sie sind primär als *termini technici* der Forschung und damit als Ausdruck wissenschaftlicher Denk- und Interpretationsmuster zu bewerten, die stets kritisch hinterfragt werden sollten. Im vorliegenden Band werden die Ergebnisse der 27. Jahrestagung zu den Grundproblemen der frühgeschichtlichen Entwicklung im mittleren Donauraum vorgelegt. Im Fokus des Interesses stehen die Region von Norikum über Pannonien bis Mösien. In methodischen Beiträgen werden Fragen der Interdisziplinarität und Periodisierung sowie anhand von Fallbeispielen aus der Untersuchungsregion Verwendung, Bedeutung und Interpretation zentraler Begriffe und Quellen beleuchtet. Sie liefern damit die Grundlage für eine Diskussion über trennende und verbindende Elemente von „Grenz(en) – und – Übergängen“ zwischen Epochen, Räumen und wissenschaftlichen Betrachtungsweisen diesseits und jenseits der Donau.

The time between AD 300 and 800 is seen as a period of transition between Antiquity and the Middle Ages; archaeologists and historians increasingly acknowledge its existence under the term ‘Late Antiquity’ as a period in its own right. Categories such as ‘Late Roman’, ‘Early Christian’ or ‘Early Byzantine’ appear in this context as competing concepts that describe chronologically and geographically overlapping phenomena. They are primarily *termini technici* used in historical research and hence expressions of thought patterns and interpretative models which must be subjected to critical scrutiny.

This volume contains the proceedings of the 27<sup>th</sup> annual conference dedicated to major issues in the Protohistory of the Middle Danube. Its focus is on a region covering Noricum, Pannonia and Moesia. It addresses questions of interdisciplinarity and periodisation within the region, in contributions on methods as well as in case studies examining the use, meaning and interpretation of concepts and sources. This forms the basis of a discussion about the elements that separate and connect the ‘boundaries’ and ‘crossings’ between periods, spaces and approaches to studying the past on both sides of the Danube.
